Immunotherapy for Type 1 Diabetes

Colin M Dayan

Cardiff University, University of Bristol,

UK T1D Immunotherapy Consortium

Disclosures

- I have lectured for or been involved as an advisor to the following companies:
- Novonordisk, Sanofi-genzyme, Janssen, Servier, Lilly, Astrazeneca, Provention Bio, UCB, MSD.
- I hold a patent jointly with Midatech plc.

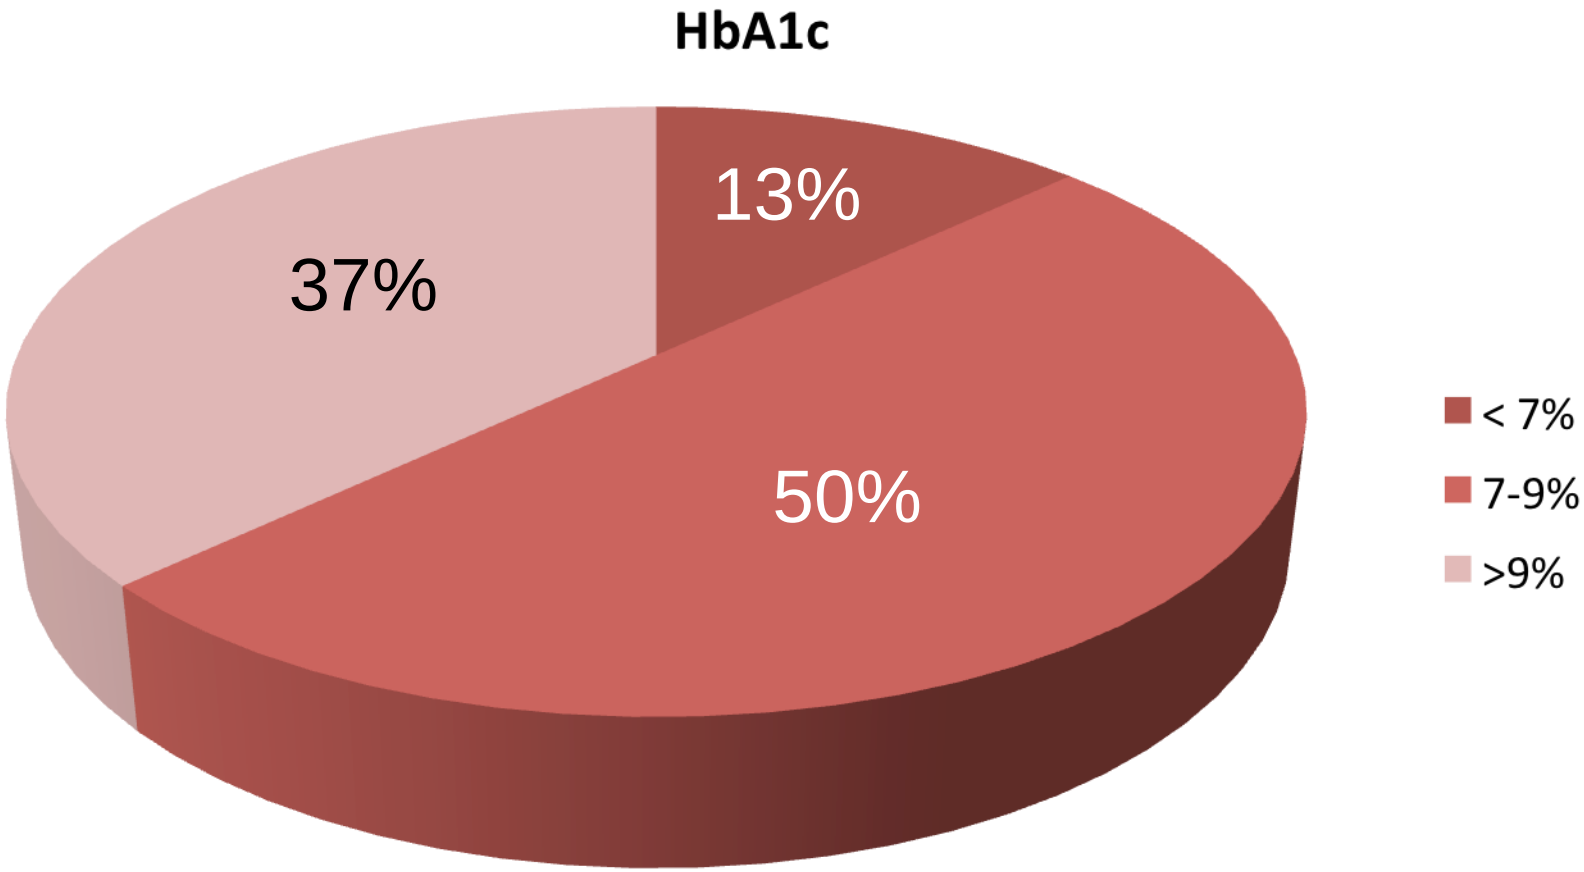
- “The transformation and subsequent eradication of type 1 diabetes is possible – it just requires sufficient ambition and focus”

Sufficient ambition …and focus

Type 1 diabetes

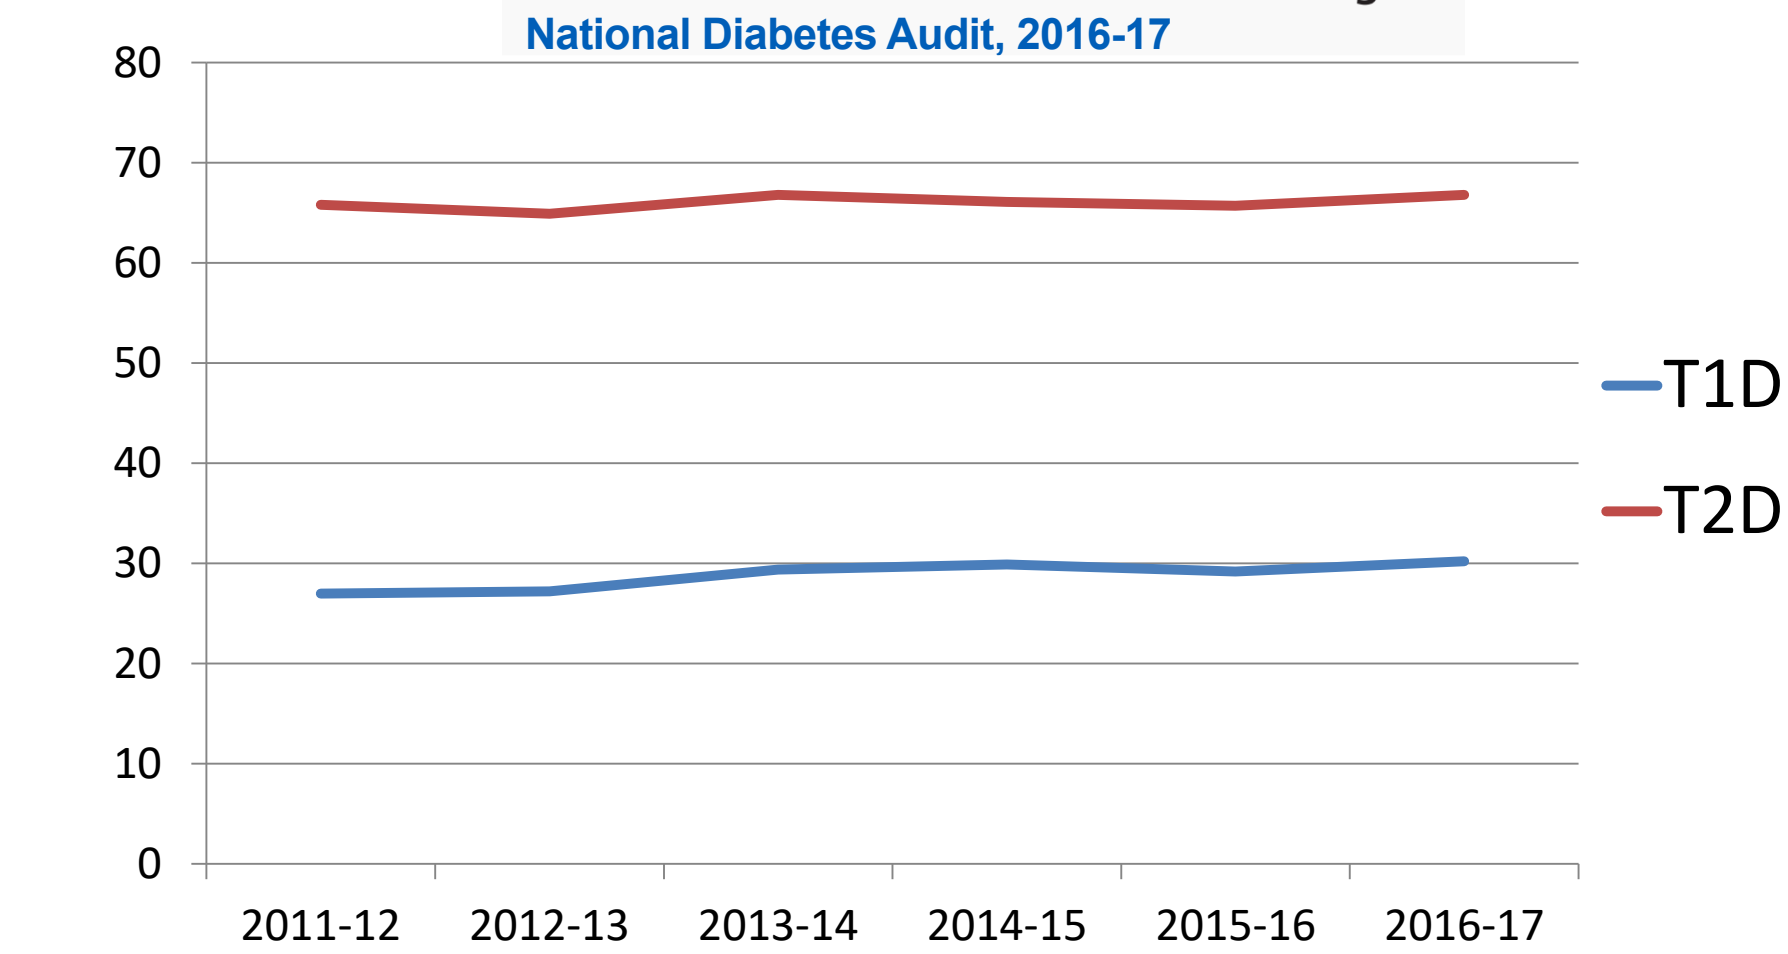
- ….. The unmet need….
- …we have to want to do this enough…

HbA1c levels in T1D in Scotland 2008 (n= 21,719)

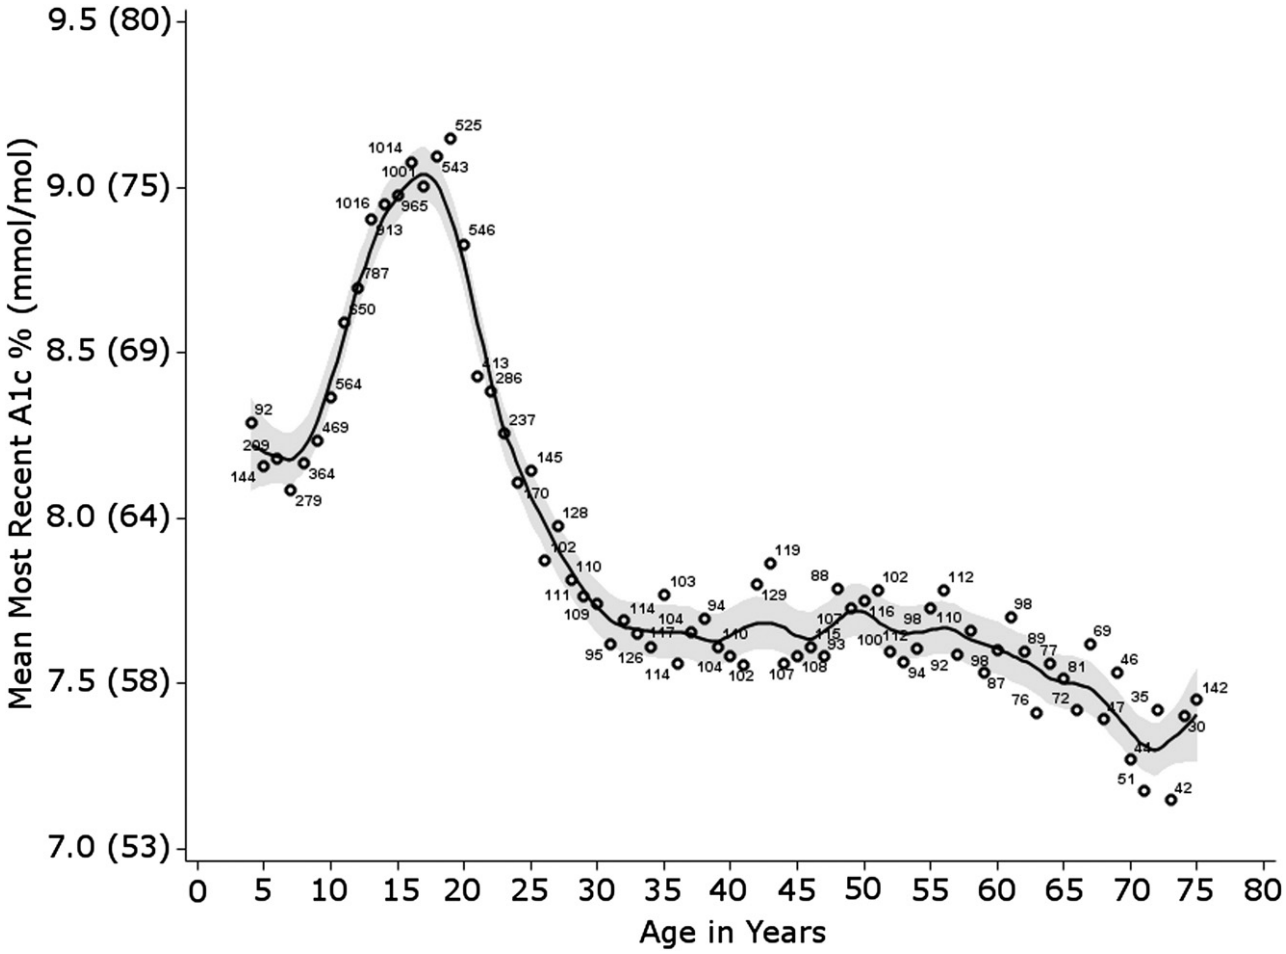


(*Livingstone et al 2012*)

UK NDA – HbA1c < 7.5%



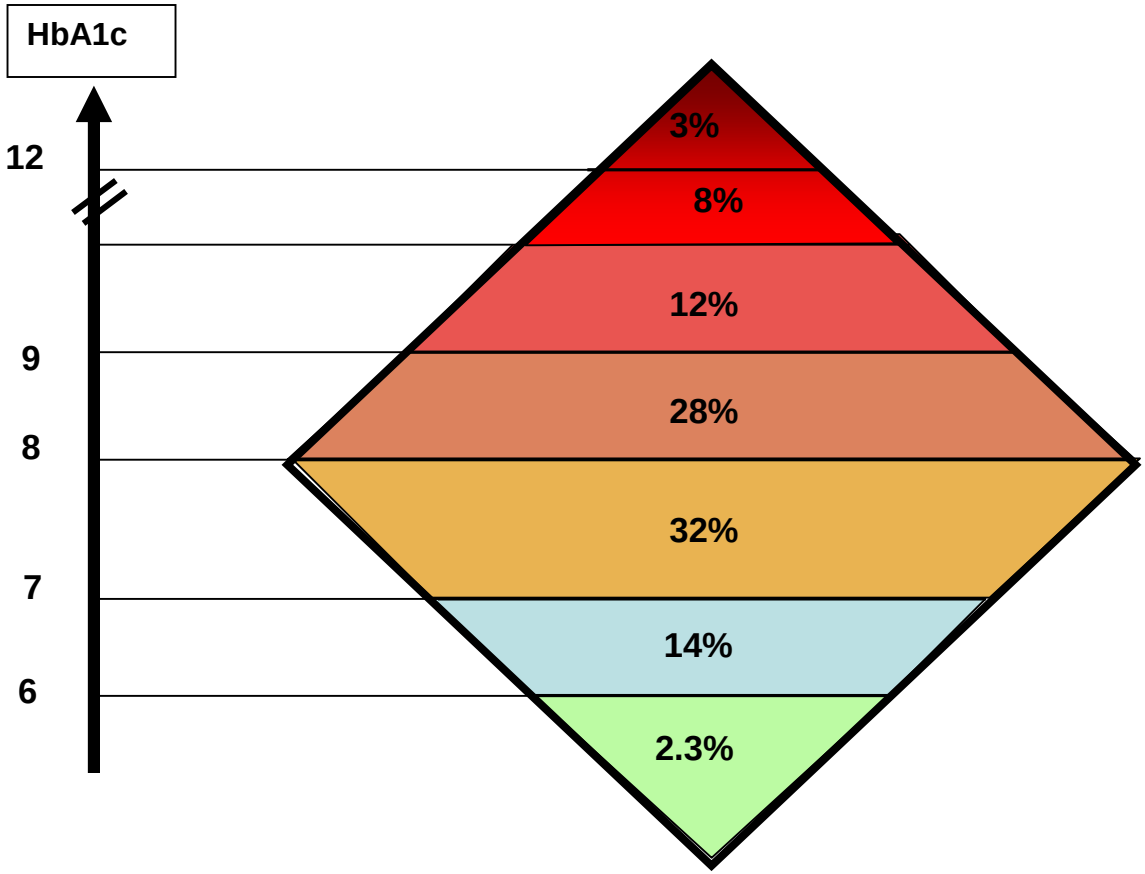
T1D Exchange data 2014 (USA)



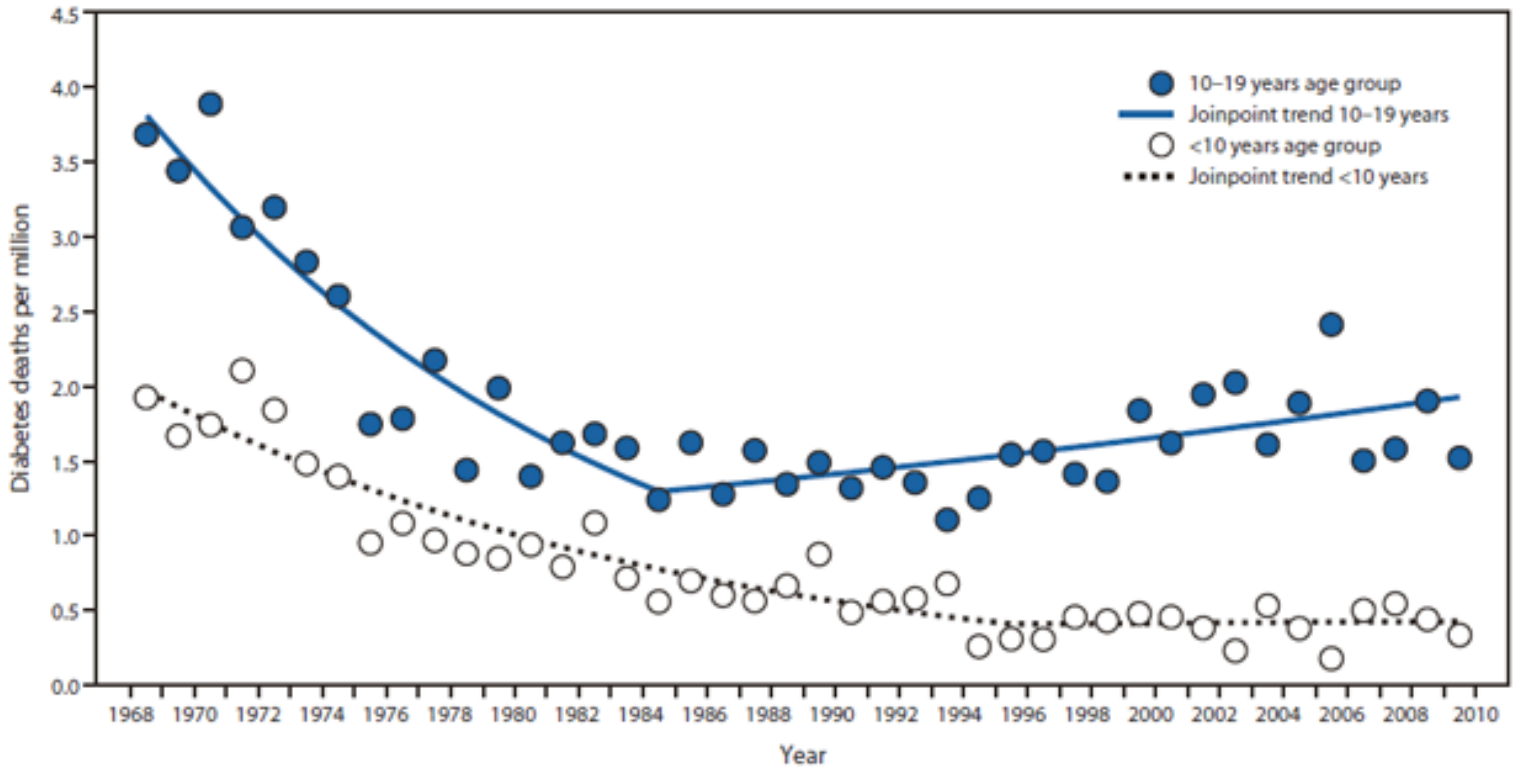
Miller et al 2015

Achieving ideal glycaemic control with insulin is almost impossible

(n=1000 from diabetes clinic)



Diabetes Death Rates Among Youths Aged ≤19 Years — United States, 1968–2009



Center for Disease Control and Prevention, 2012

Excess mortality in young people with T1D is due to DKA and hypoglycaemia

Excess all-cause mortality before age 30 in childhood onset type 1 diabetes: data from the Brecon Group Cohort in Wales

Diana R Wasag,[1] John W Gregory,[2] Colin Dayan,[3] John N Harvey,[1] on behalf of the Brecon Group

What this study adds?

- A near threefold excess mortality persists with no clear evidence of change over time in this age group (before age 30) when compared with other surveys.
- Before age 30, the excess mortality is not due to nephropathy and microvascular complications.
- Ketoacidosis remains the leading cause of death in these patients. Hypoglycaemia also contributes to mortality.

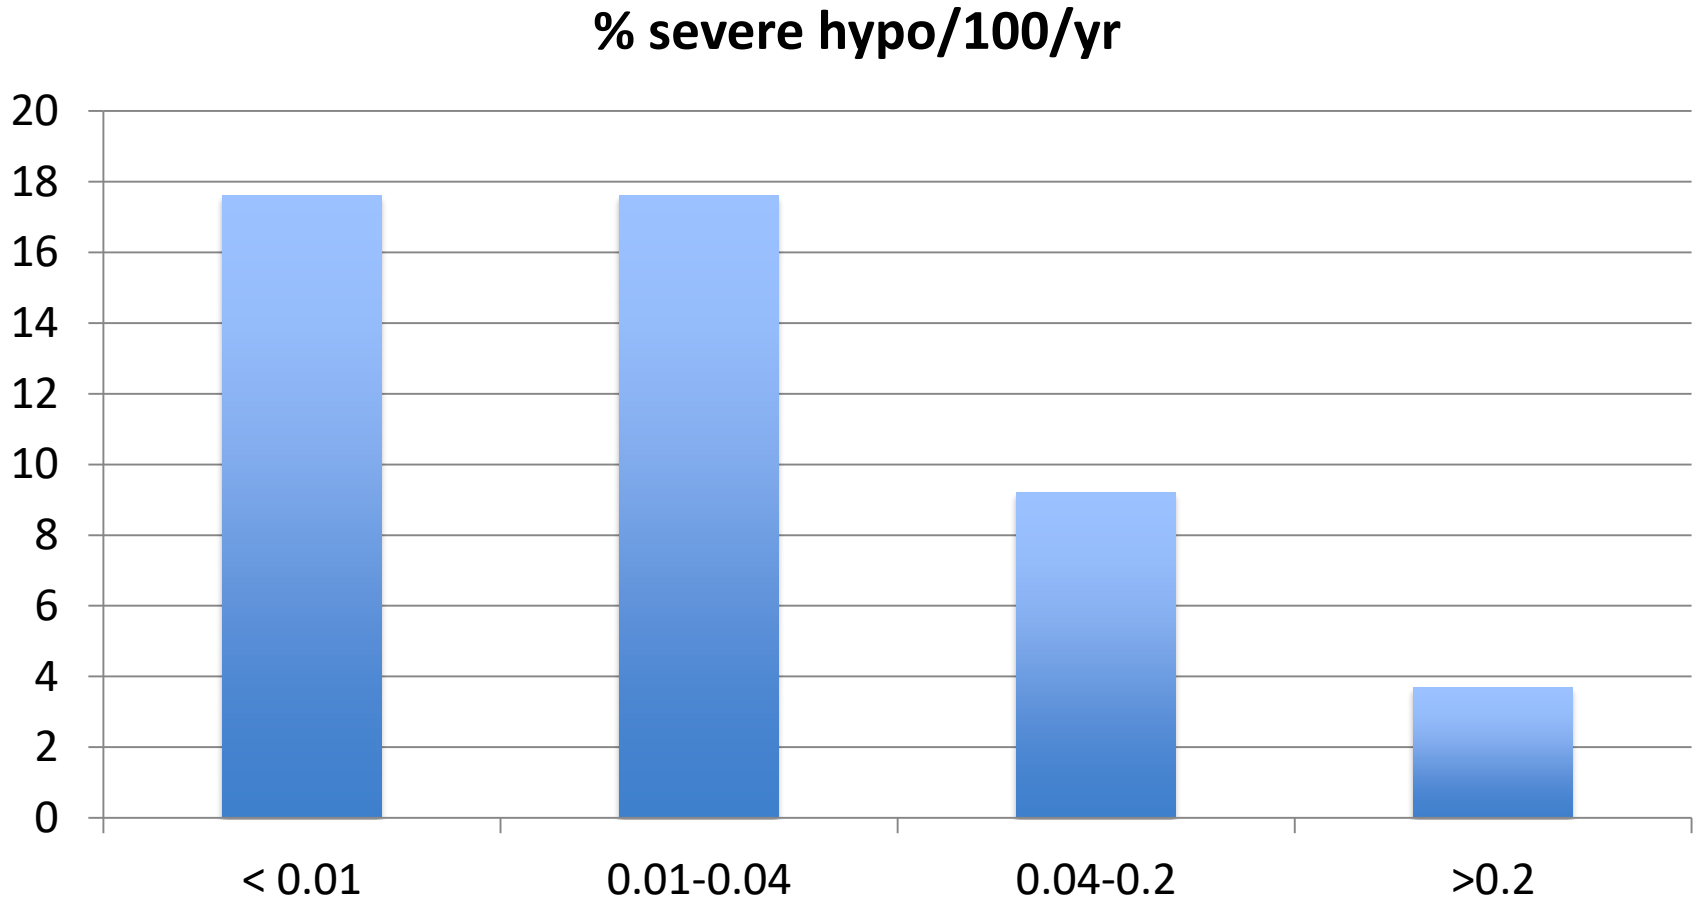
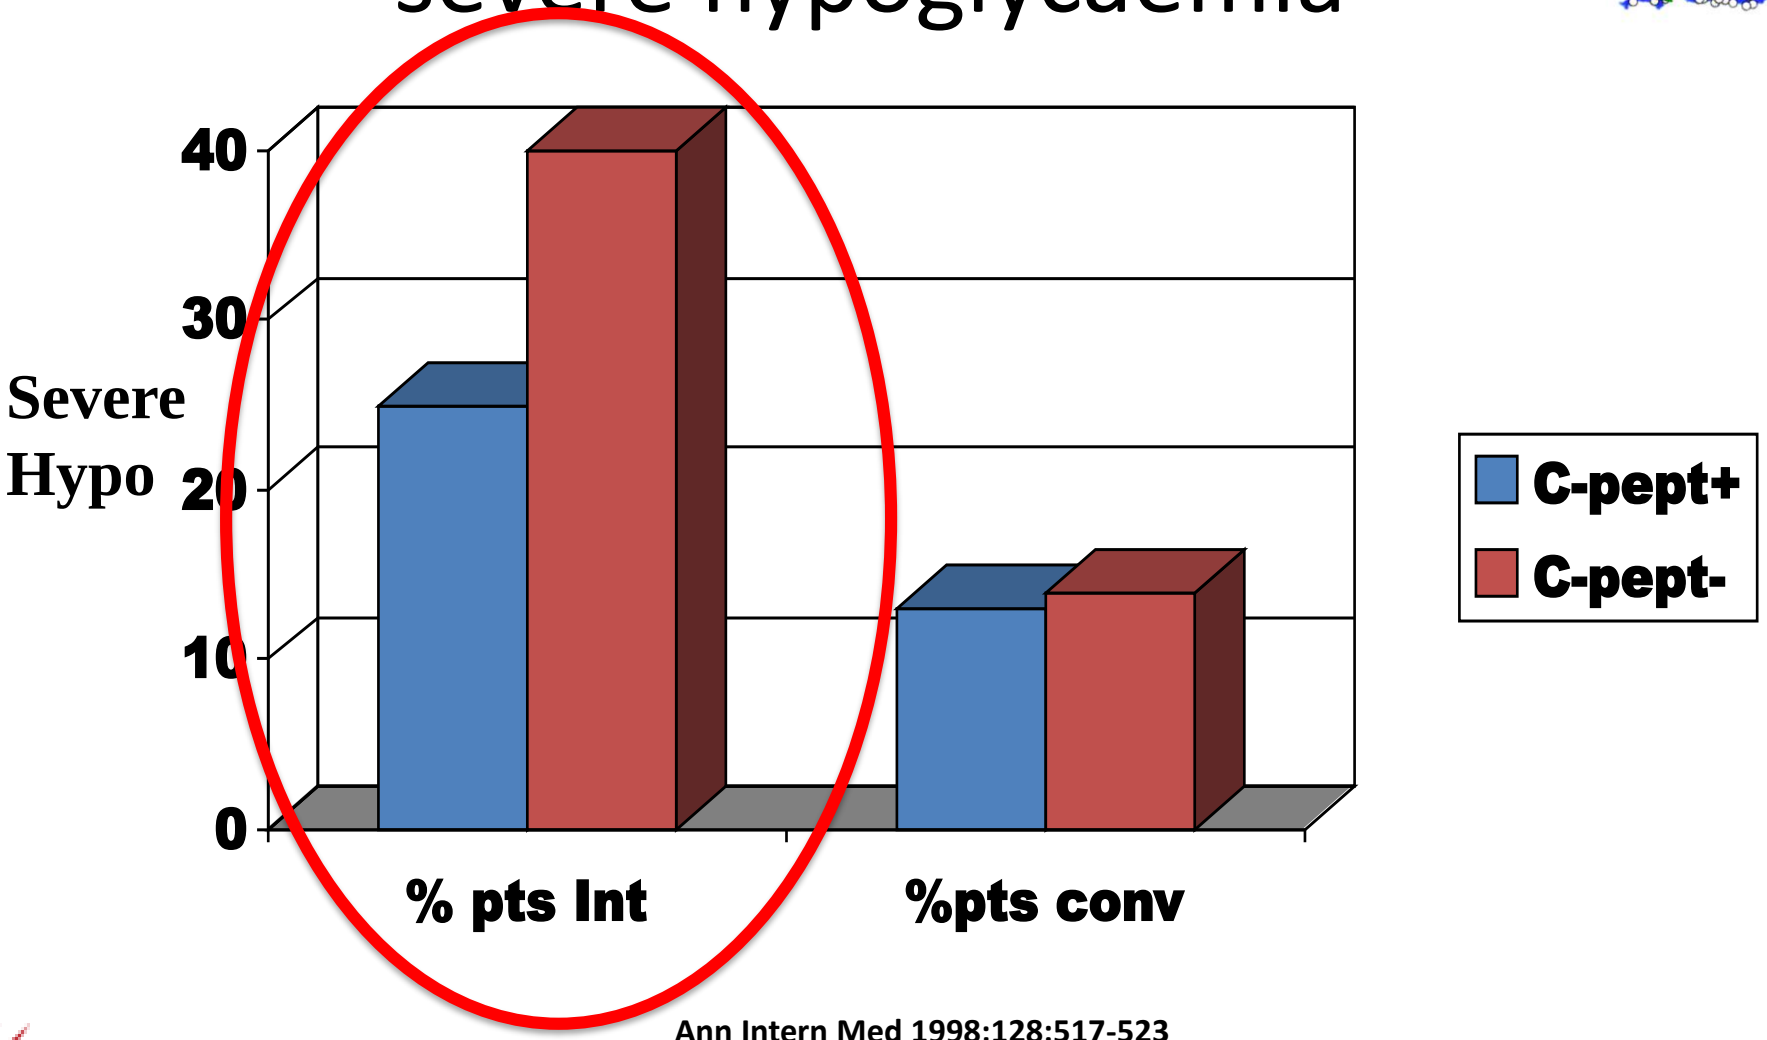
Risk of severe hypoglycaemia in Danish children



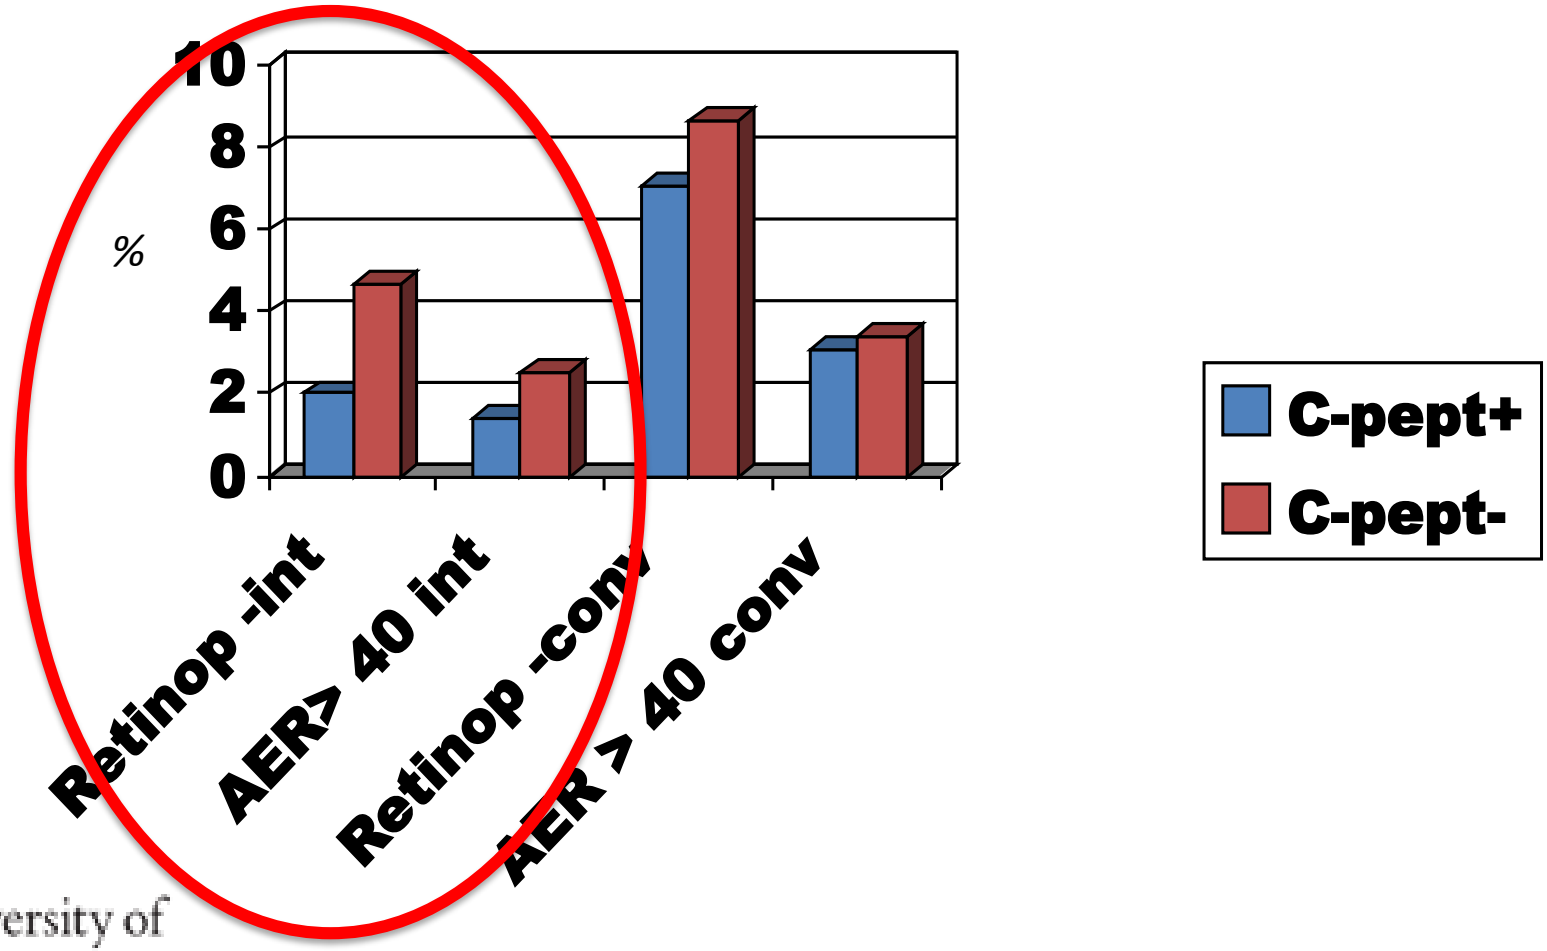
Sorensen et al 2013

Residual insulin reduces the risk of severe hypoglycaemia



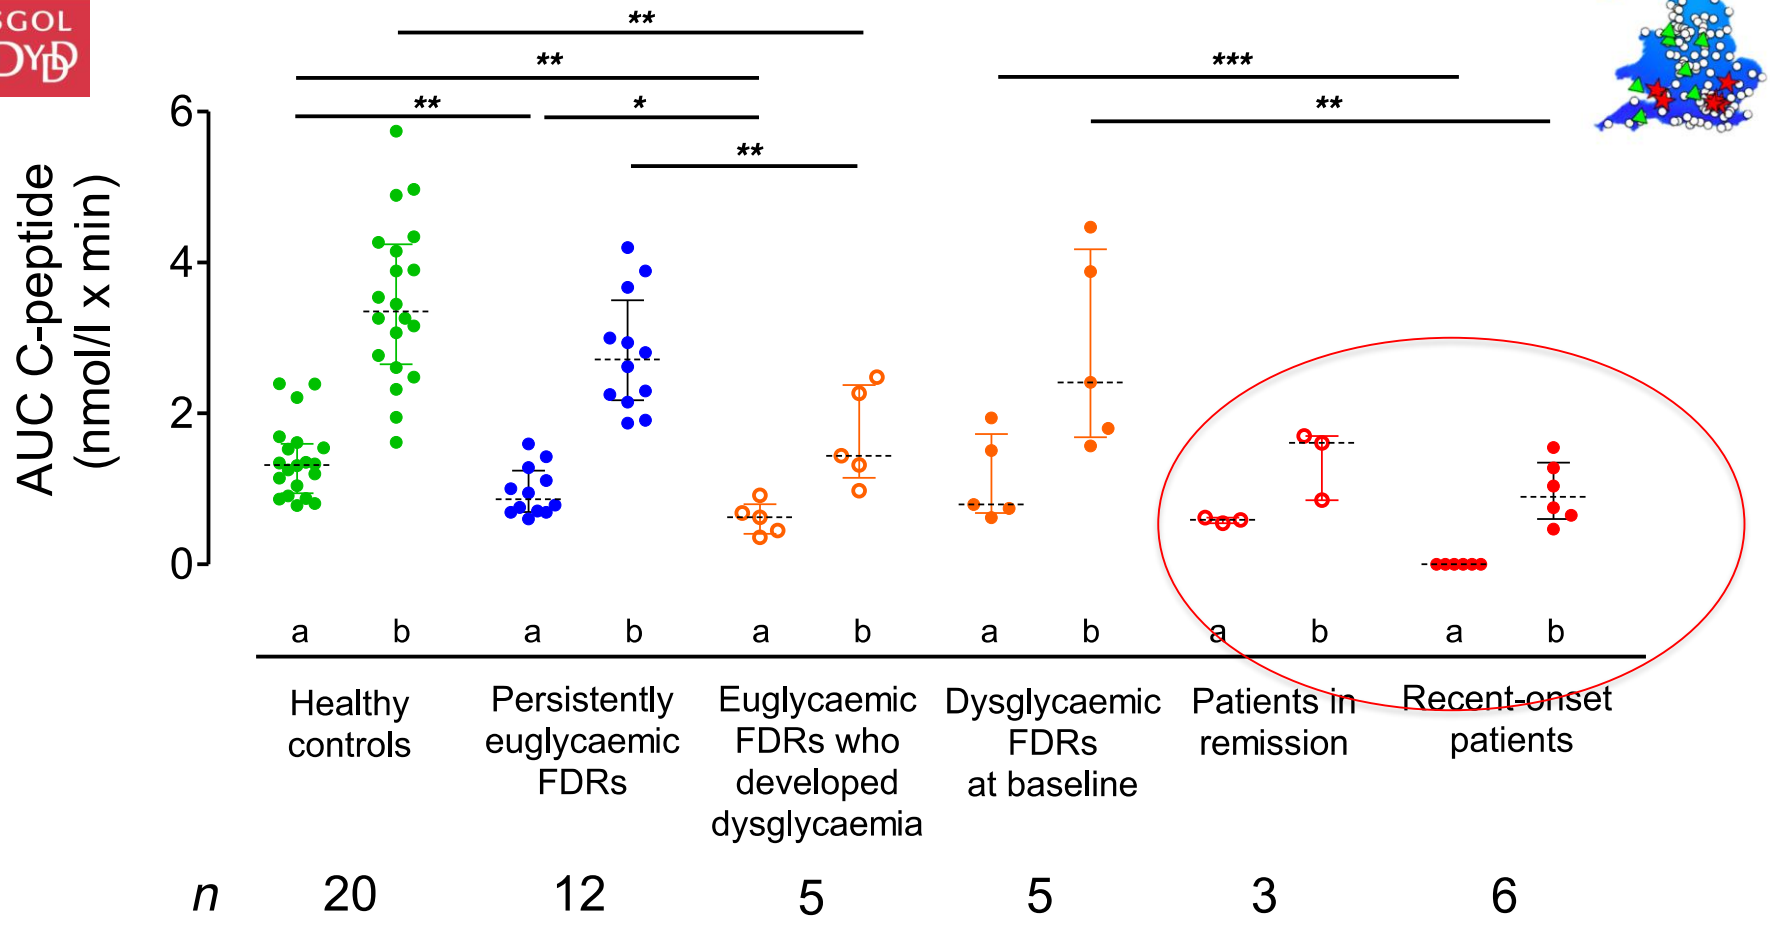
Ann Intern Med 1998;128:517-523

Long term outcomes in DDCT study vs c-pept at entry



Why do people like Libre?

- Because of the arrows….making life more predictable

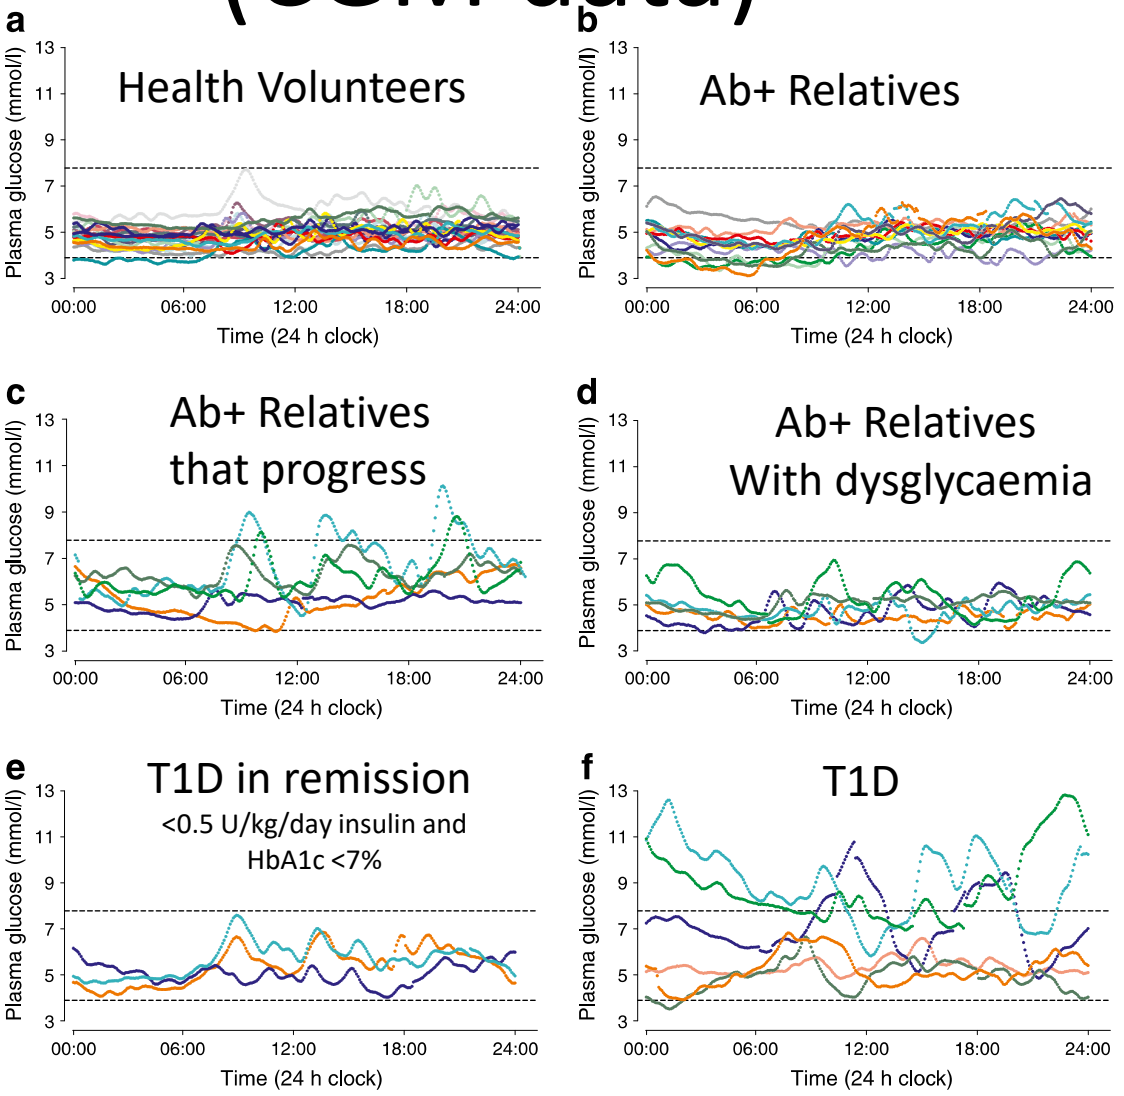


ESM Figure 1 - Baseline first-phase C-peptide release (a) and second-phase C-peptide release (b) during hyperglycaemic clamp for the various groups of participants. Data are dot plots with indication of median values and interquartile range.

*p<0.05, **p<0.01, ***p<0.001

Keymeulen et al 2015

Glycemic Variability (CGM data)



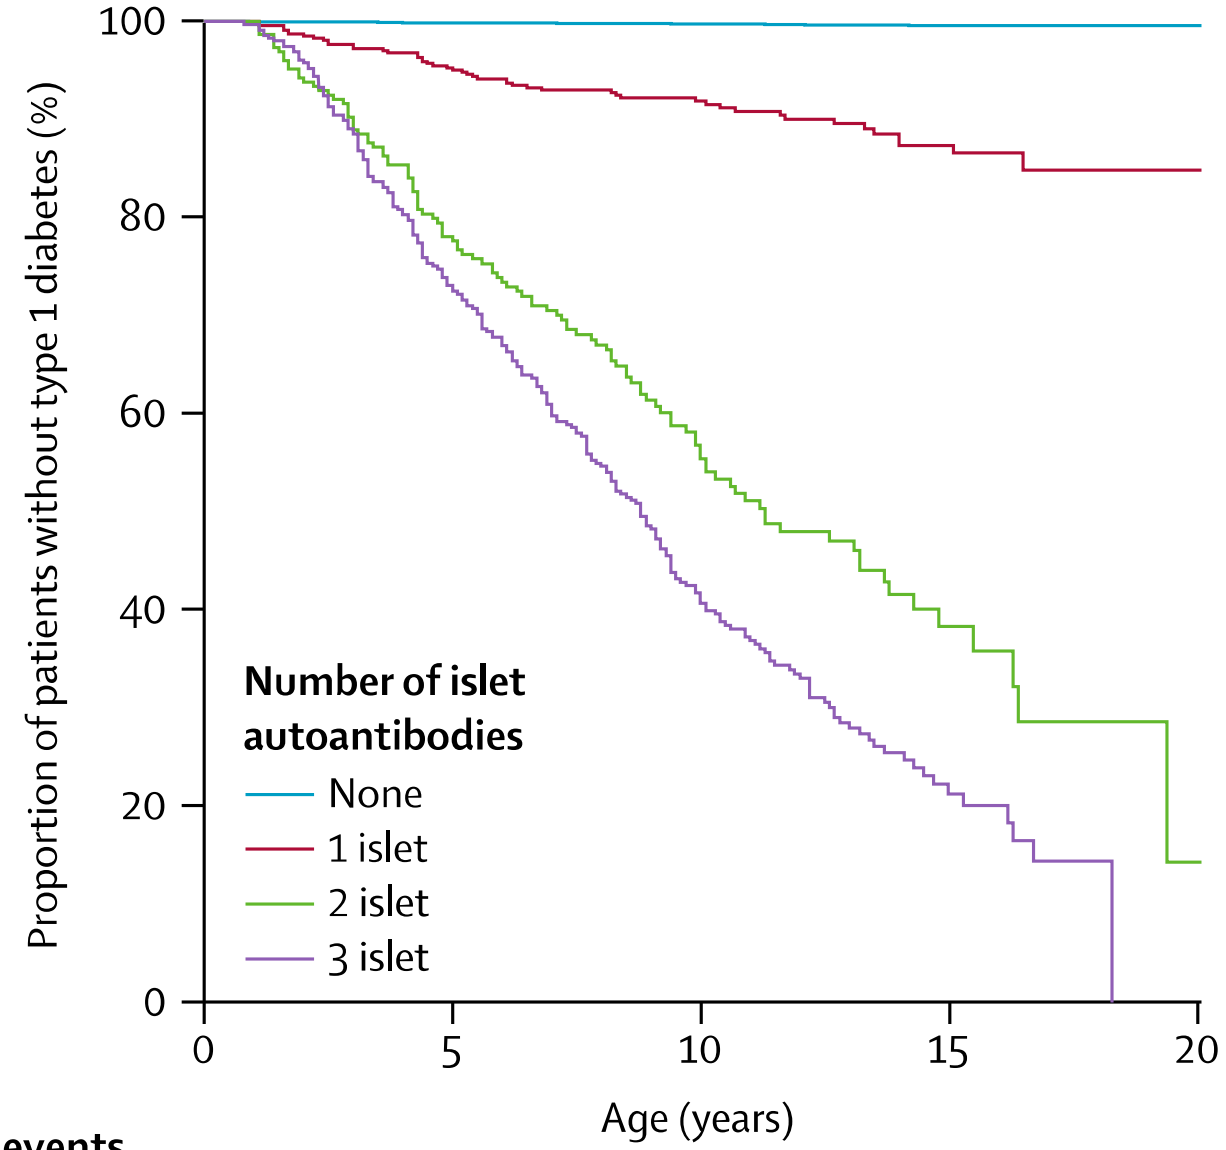
Keymeulen et al 2015

Goal

- *"The best beta cells are your own beta cells"*
- *Preserving as much endogenous beta cell function as possible for as long as possible has the potential to improve short and long term outcomes markedly in T1D*
  - *Glucose variability*
  - *Hypoglycaemia*
  - *Ketoacidosis*
  - *Achievable HbA1c*
  - *Reduced complications – "legacy effect"*

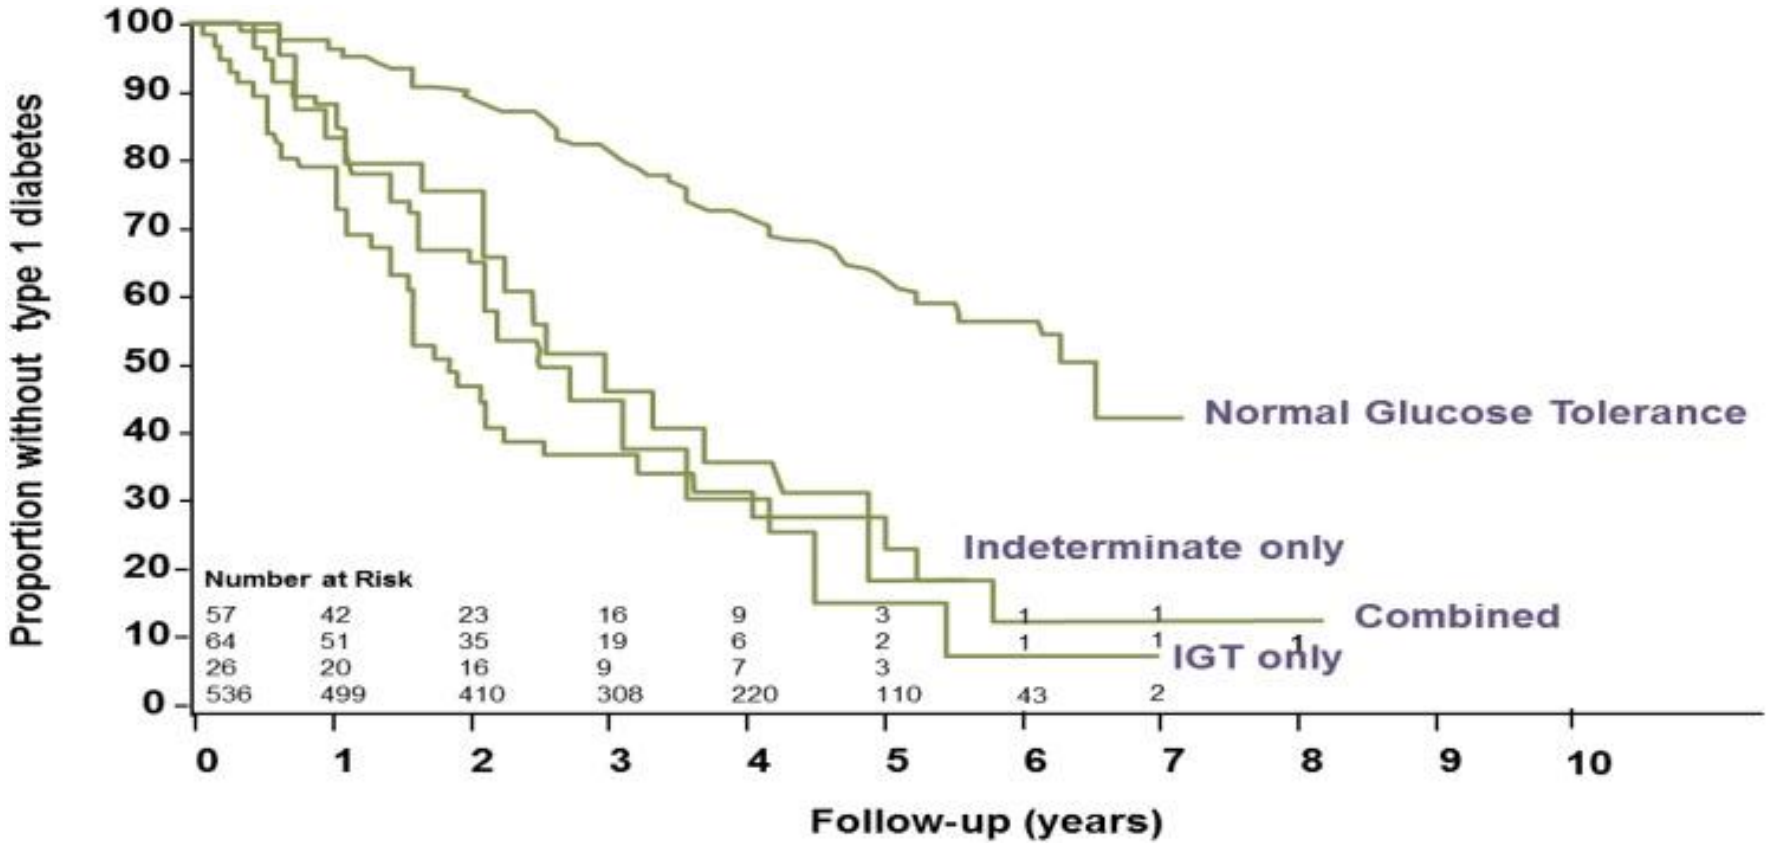
- *Preserving as much endogenous beta cell functions as possible for as long as possible has the potential to improve outcomes markedly in T1D….especially for those least engaged with their therapy*

Autoantibodies are present many years before people are diagnosed with type 1 diabetes

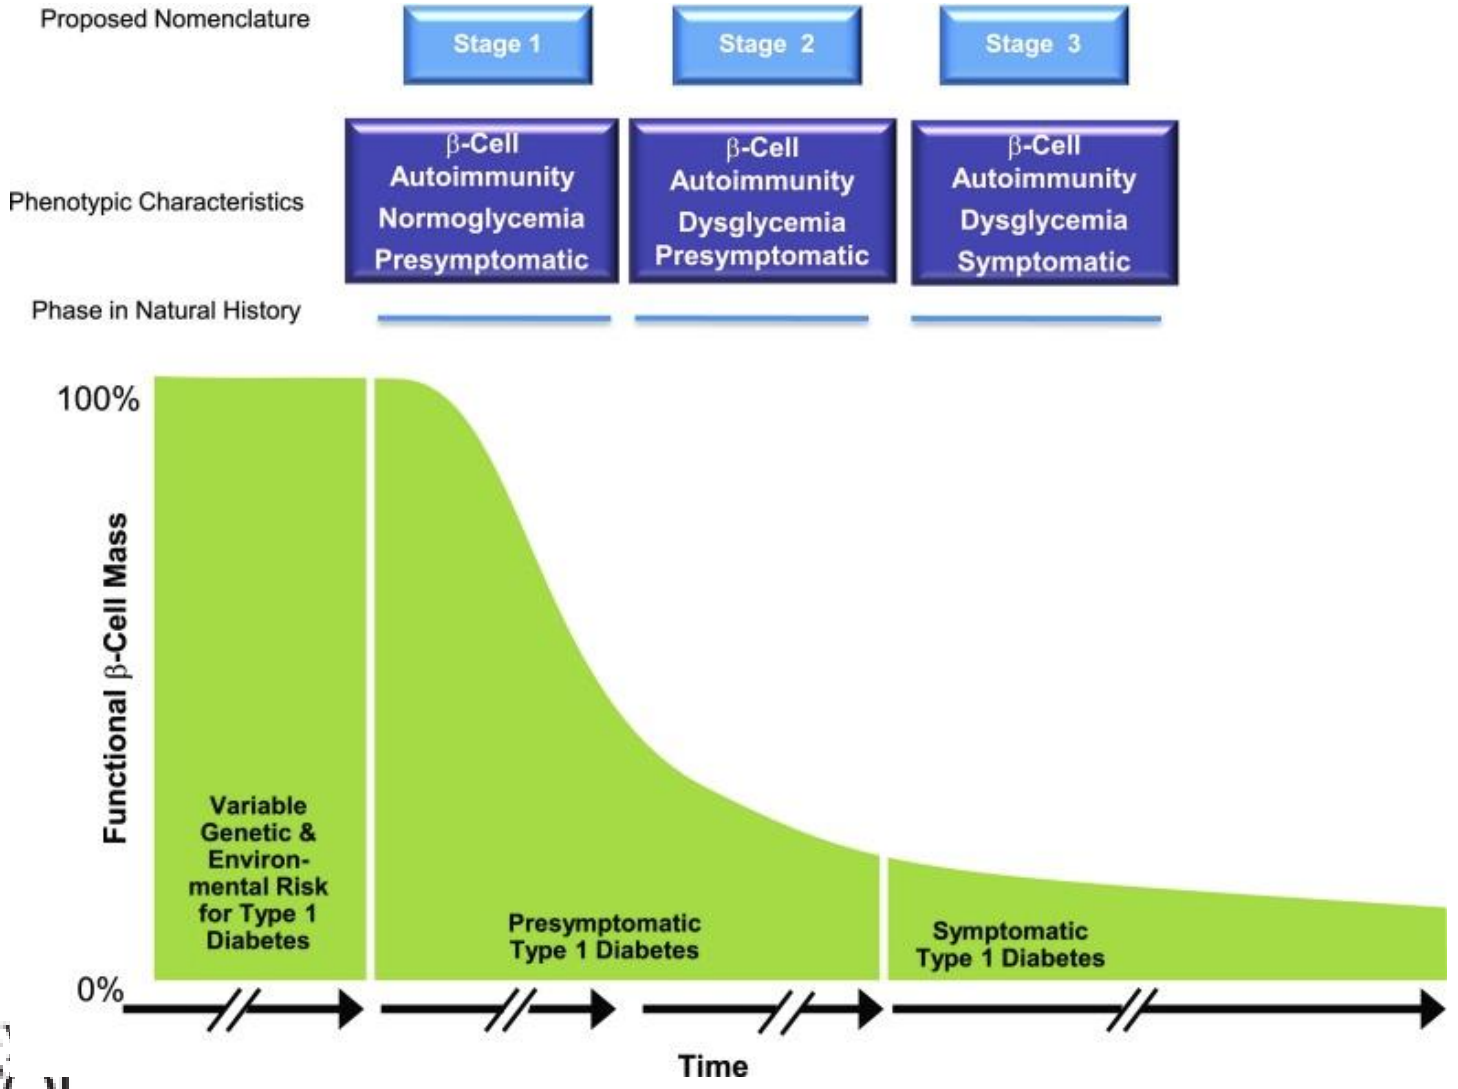


Number of events

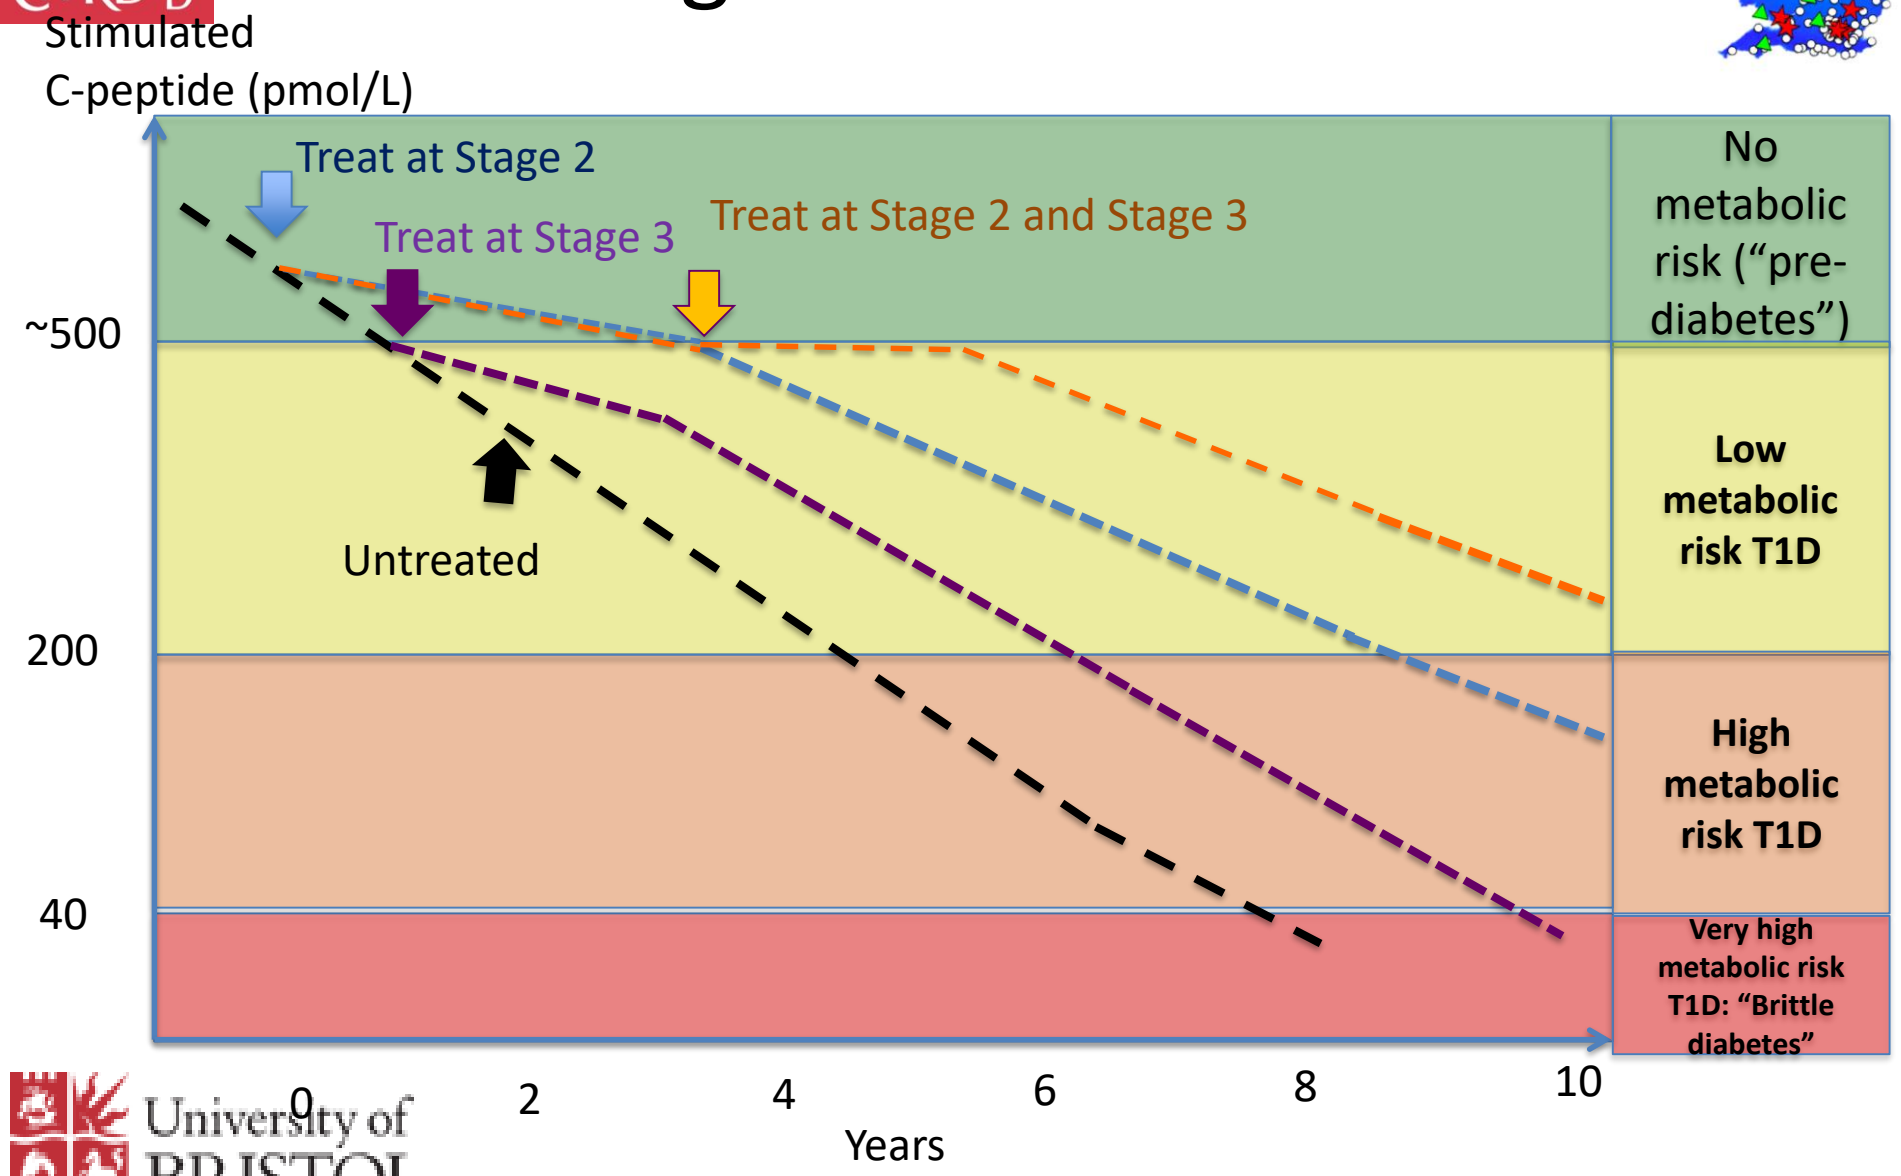
Progression from dysglycaemia



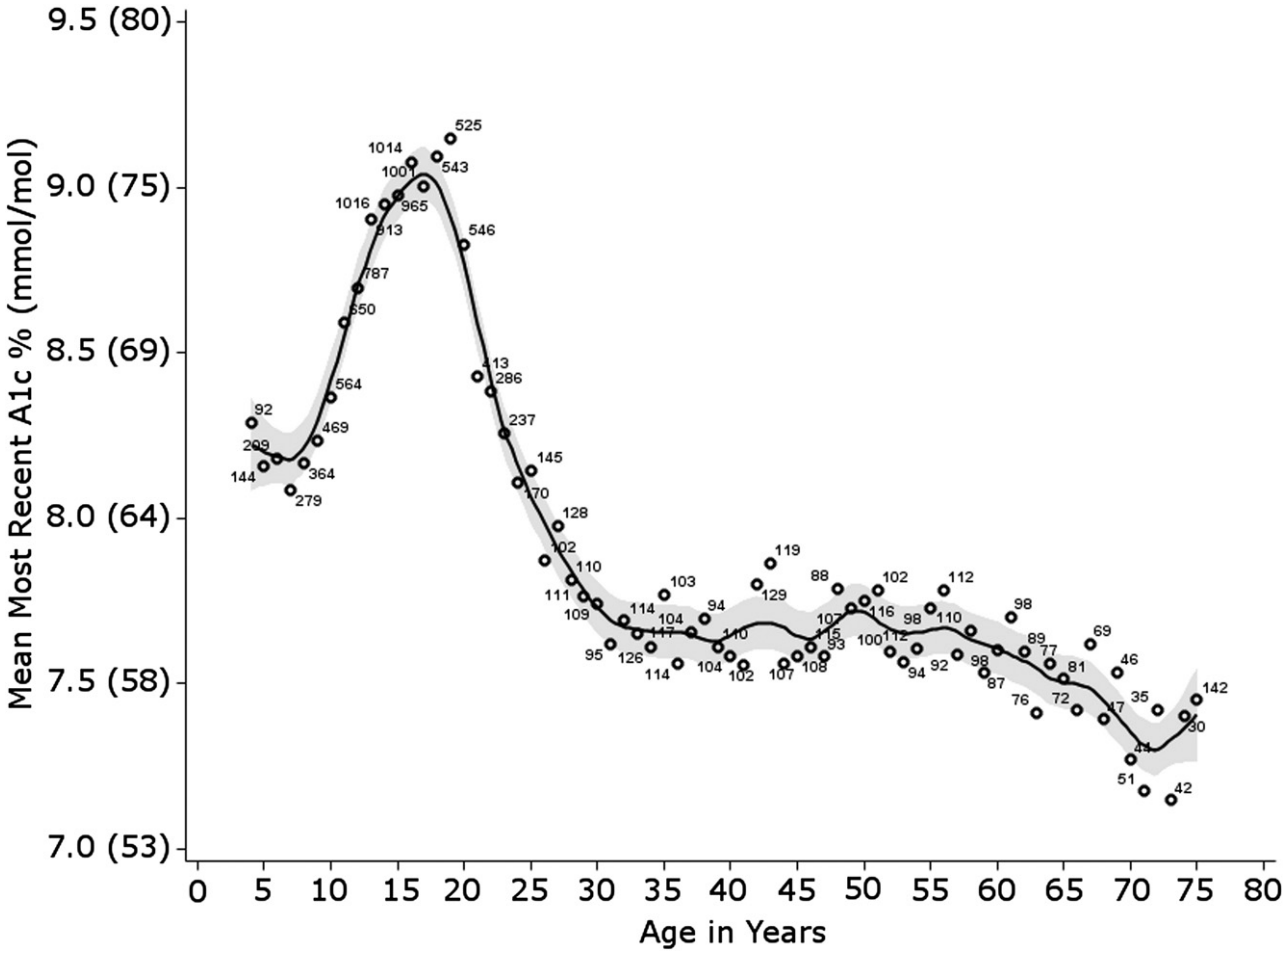
Staging of type 1 diabetes



Maintaining low metabolic risk T1D



T1D Exchange data 2014 (USA)



Miller et al 2015

Low risk immunotherapy

Immunointervention: Optimising benefit vs risk

Different types of immunotherapy

Treatment	Example	Risk of side-effects
General Immunosuppression	Drugs use for organ transplants	High

Different types of immunotherapy

Treatment	Example	Risk of side-effects
General Immunosuppression	Drugs use for organ transplants	High
Selective immunosuppression	Newer drugs used for example in arthritis, skin diseases	Low

Different types of immunotherapy

Treatment	Example	Risk of side-effects
General Immunosuppression	Drugs use for organ transplants	High
Selective immunosuppression	Newer drugs used for example in arthritis, skin diseases	Low
Boosting immune regulation	“vaccines”, protective cells, drugs to boost protective cells	Very low

Different types of immunotherapy

Treatment	Example	Risk of side-effects
General Immunosuppression	Drugs use for organ transplants	High
Selective immunosuppression	Newer drugs used for example in arthritis, skin diseases	Low
Boosting immune regulation	“vaccines”, protective cells, drugs to boost protective cells	Very low

Immunobiologics licensed for psoriasis

- Anti-TNF
  - Infliximab
  - Etanercept
  - Adilimumab
- Anti-IL-12/IL-23
  - Ustekinumab

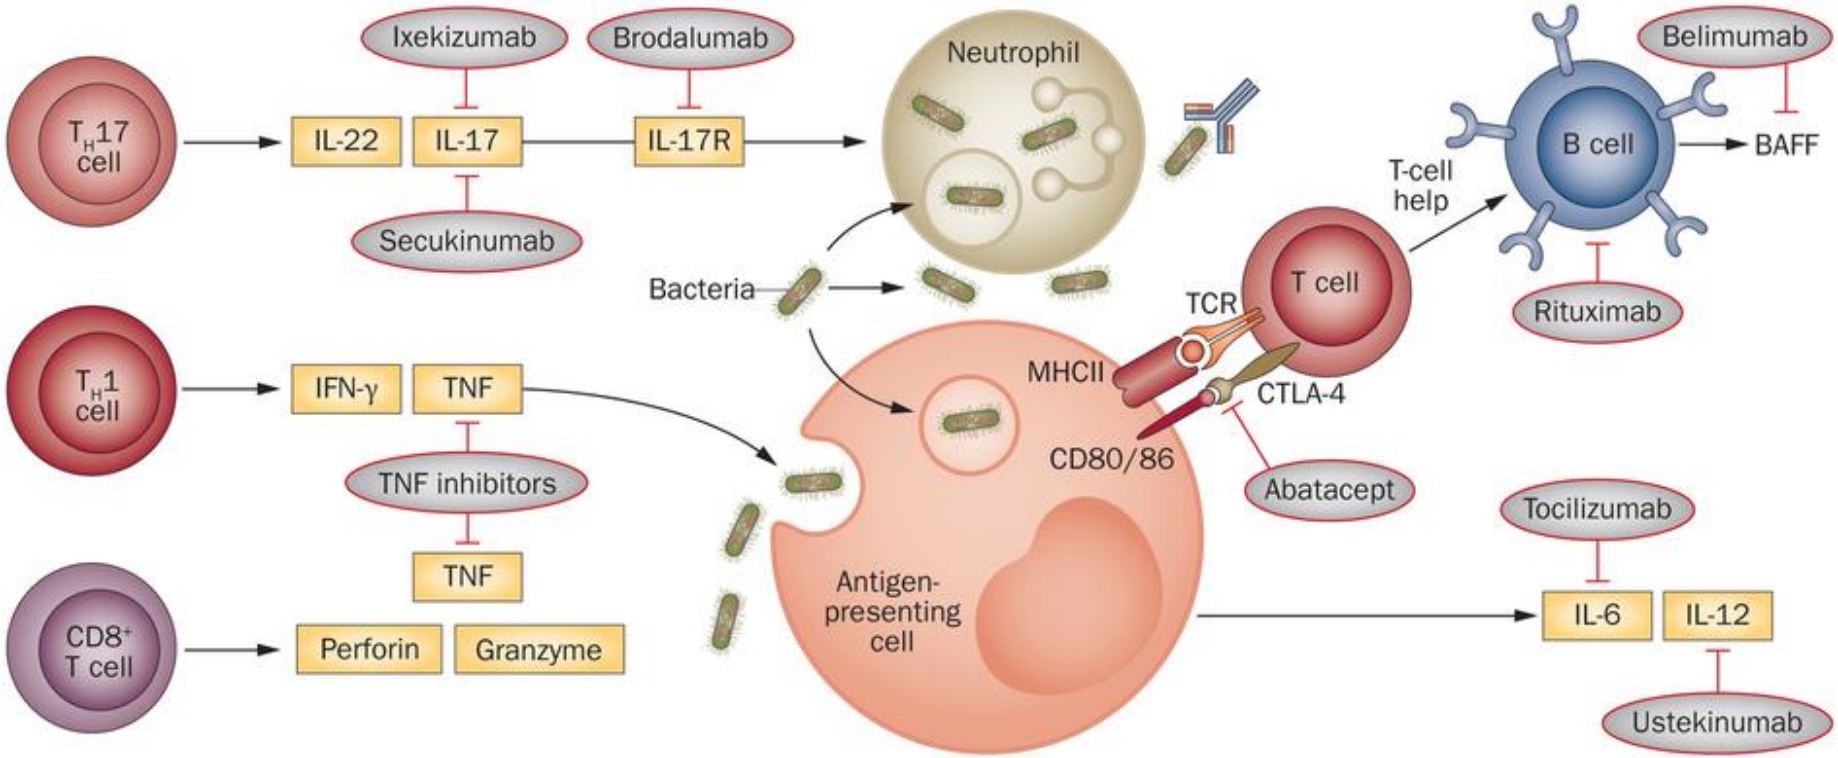
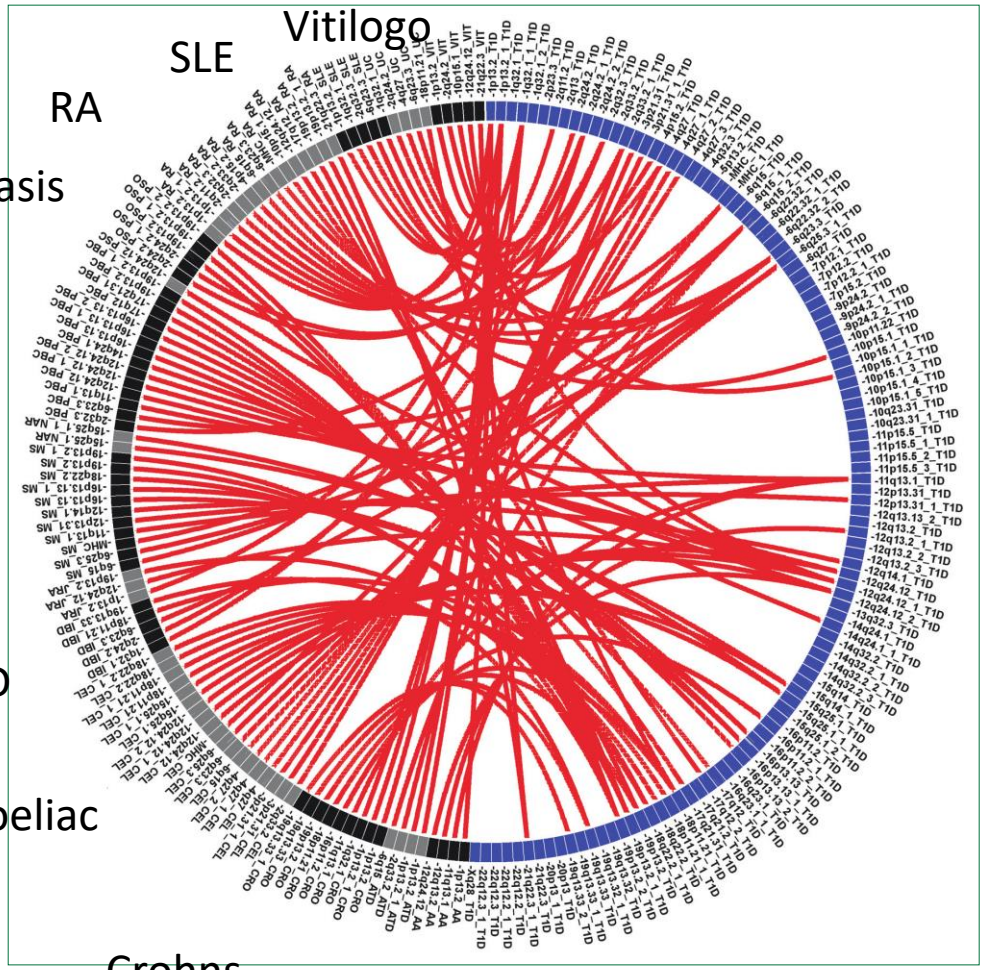
  - Ixekizumab
  - Secukinumab
  - Brodalumab
- Anti-IL-23
  - Guselkumab

The immune system



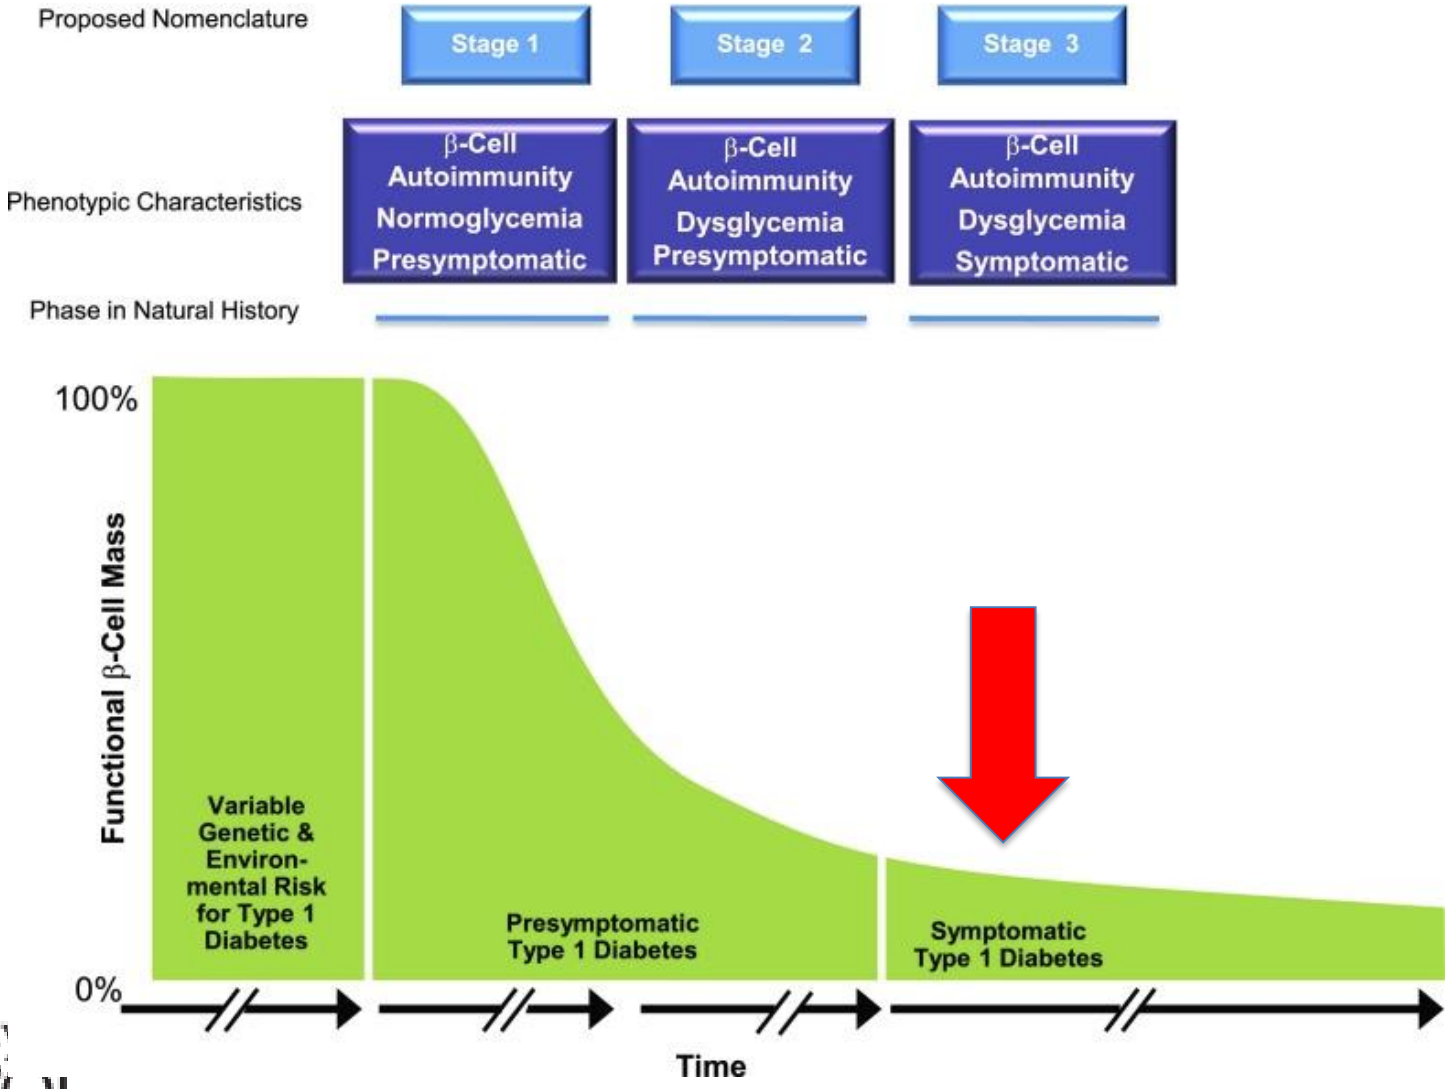
Genetic overlap with other autoimmune diseases (around 50%)



Pociot and Lernmark 2016

Figure 5: **Circos plot of the sharing between type 1 diabetes loci with other immune-mediated diseases**
Data are retrieved from the ImmunoBase website. Associated loci for each disease are listed around the circumference according to chromosomal order. About half of the type 1 diabetes peak SNPs show association with another disease. All type 1 diabetes peak SNPs are shown in the blue part of the circle, and red lines identify pleiotropic risk SNPs. SNP=single nucleotide polymorphism. AA=alopecia areata. ATD=autoimmune thyroid disease. CEL=coeliac disease. CRO=Crohn's disease. IBD=inflammatory bowel disease. JRA=juvenile rheumatoid arthritis. MS=multiple sclerosis. NAR=narcolepsy. PBC=primary biliary cirrhosis. PSC=primary sclerosing cholangitis. PSO=psoriasis. RA=rheumatoid arthritis. SLE=systemic lupus erythematosus. T1D=type 1 diabetes. UC=ulcerative colitis. VIT=vitiligo.

Immunotherapy of type 1 diabetes



Immunotherapies with clinical trial evidence of beta cell preservaton

- Anti-CD3
- Anti-CD2
- Anti-CD20
- ATG
- CTLA-4Ig
- (anti-TNF)

Most durable effects from T cell depletion and repopulation

- Anti-CD3
- ATG
- Alefacept

Teplizumab for treatment of type 1 diabetes (Protégé study): 1-year results from a randomised, placebo-controlled trial

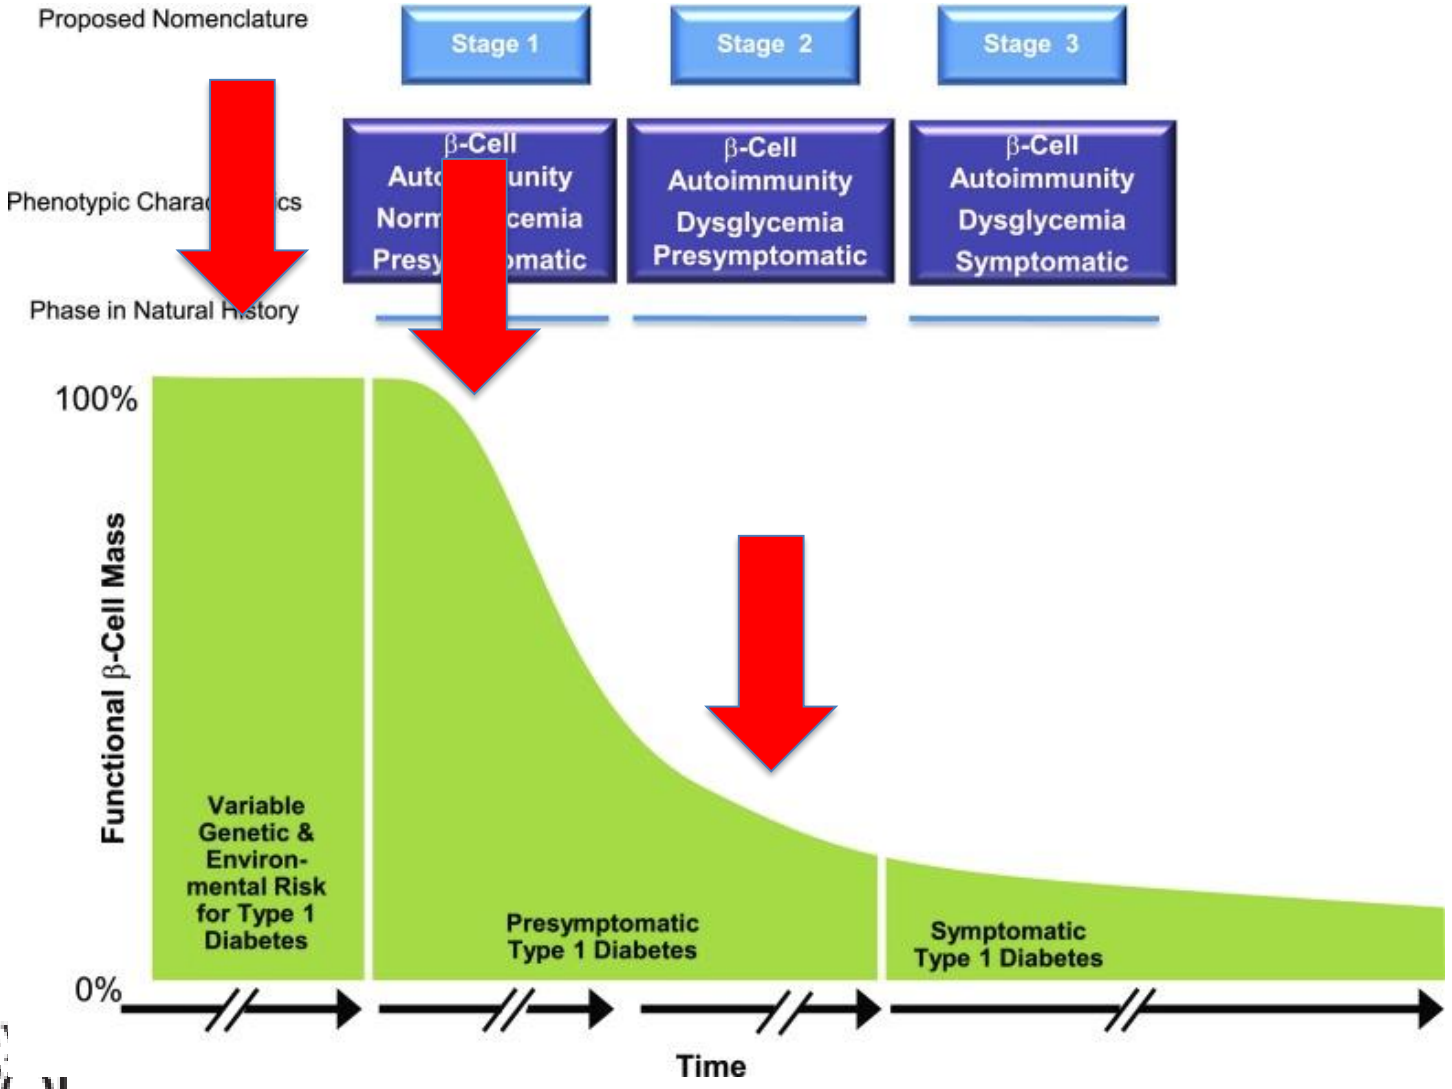
Peptide therapy given up to 12 times was safe with no hypersensitivity or exacerbation of disease

Immunotherapy of type 1 diabetes



Risk of diabetes

GPPAD

GLOBAL PLATFORM FOR THE PREVENTION OF AUTOIMMUNE DIABETES

A WORLD WITHOUT 1

Why is there no licensed therapy for T1D?

1. **The "Curse" of insulin**
   - Unmet need is not perceived
2. **Need to treat soon after diagnosis**
   - < 5% of people can take part in trials and "protected"
3. **Trial end point (MMTT) "difficult"**
   - Slow (12 months)
   - Unsuitable for children
4. **No surrogate biomarkers or imaging technique**
   - Can't screen drugs rapidly against target
   - Can't dose optimise
5. **No defined clinical endpoint**
   - No regulatory approval path
6. **Only a "cure" will do…and it should be low risk!**
   - No other autoimmune disease is cured

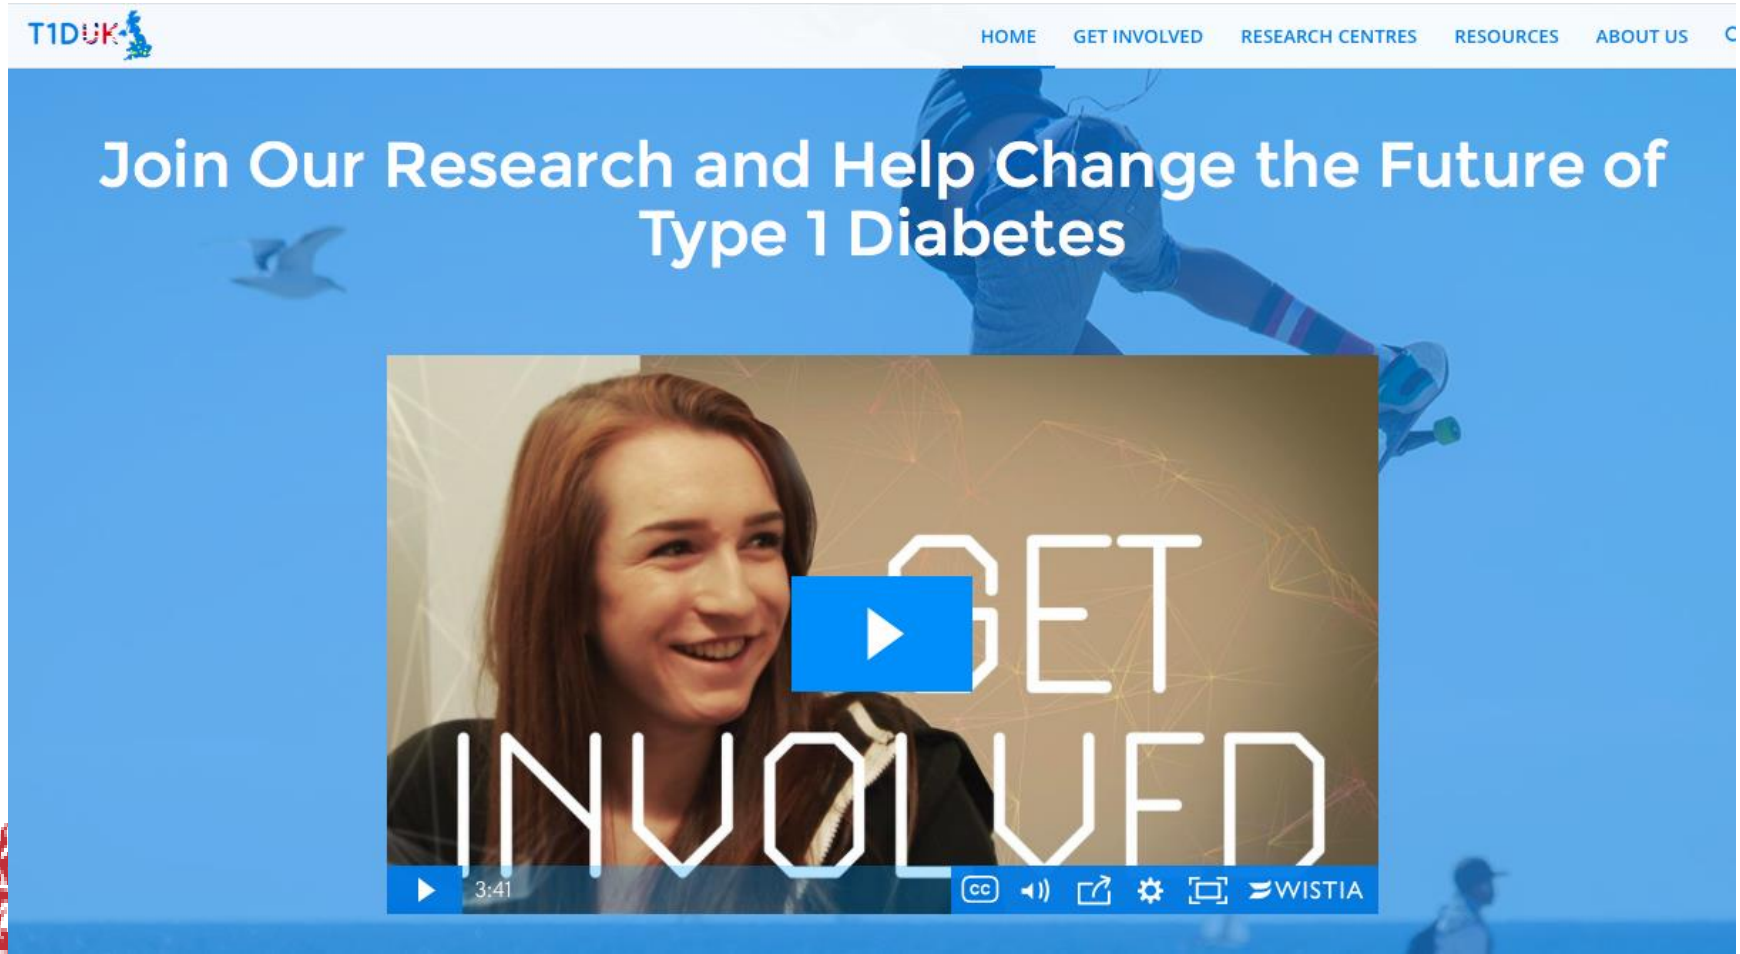
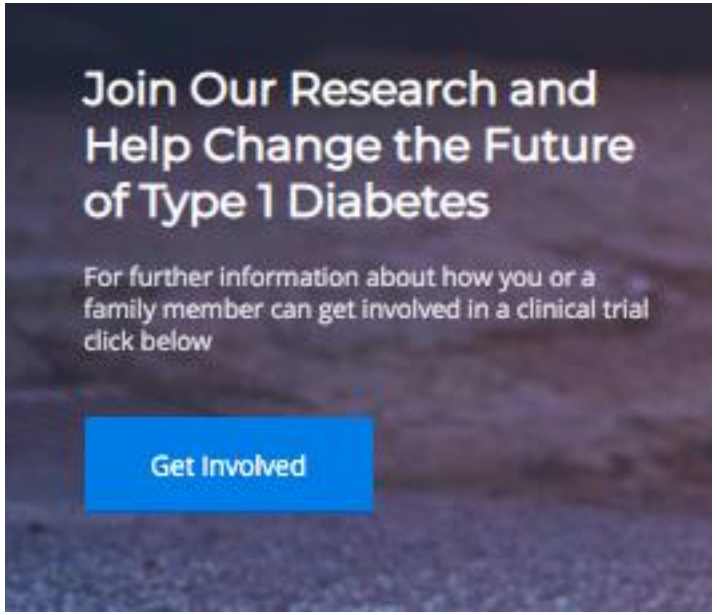
IMMUNOTHERAPY

University of BRISTOL

www.type1diabetesresearch.org.uk



T1D UK Consortium

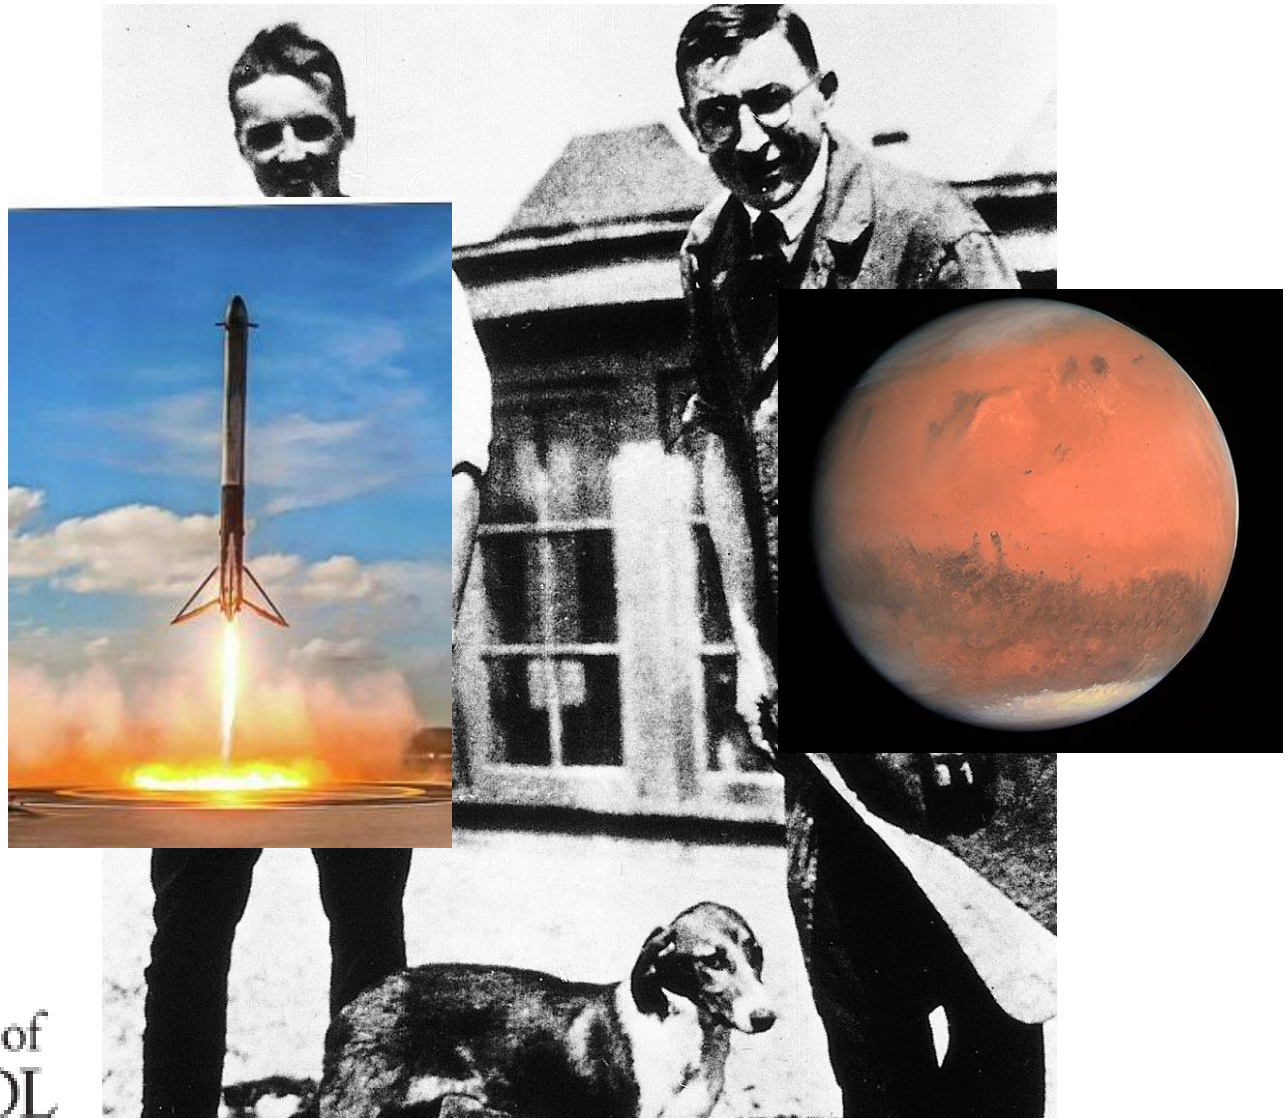


Conclusions

- Significant unmet need of glycaemic control in T1D
- Benefits of even short term preservation of small amounts of c-peptide preservation
  - Short term: Less hypoglycaemia, more time in range less DKA
  - Medium term – death rates, DKA rates, pregnancy outcomes, educational outcomes
  - Long term: reduced long-term complications
- Low risk immunotherapy is here today – let's get it over the line
- Antigen specific immunotherapy and disease prevention will be here tomorrow

CARDIFF UNIVERSITY
PRIFYSGOL CAERDYDD

Eradication of Type 1 diabetes 2041



University of BRISTOL

Vision post-2021

2021 2025 2031 2035 2041

Antigen specific immotherapy

Diabetes Prevention begins

Many companies marketing other low-risk immunotherapies

First beta cell preserving therapy licensed

Beta cell preservation becomes priority at diagnosis:
"As much as possible for as long as possible"

40% of adults and 20% of children > 200pmol for 5yrs

- T1D incidence falls
- Low c-peptide T1D is rare

Diagnose T1D Earlier (more c-peptide)

Beta cell regenerative therapies

Beta cell restoration in longstanding patients
